Notes on sources and methodology:

a. Number of Acute Clinical Cases Reported:

For hepatitis A and hepatitis B, the number of cases reported to the National Notifiable Disease Surveillance System (NNDS). Cases of hepatitis C/NANB are also reported to NNDS (1,150 cases in 2003) but are unreliable for monitoring trends in hepatitis C because these reports include cases based only on a positive lab test for anti-HCV, most of which represent chronic HCV infection. (CDC: Summary of Notifiable Diseases, United States, 2002, MMWR 2003;51(53)

b. Estimated Number of Clinical Cases and New infections

Incidence estimates are derived from catalytic modeling of seroprevalence data from the Third National Health and Nutrition Examination Survey (NHANES III) applied to cases reported to the Nationally Notifiable Disease Surveillance System (NNDS) (for hepatitis A and hepatitis B) or to the Sentinel Counties Study of Viral Hepatitis (for hepatitis C).

d. Estimated Annual Number of Chronic Liver Disease Deaths

e. Percent ever infected

Seroprevalence estimates for HAV, HBV and HCV come from the Third National Health and Nutrition Examination Survey (HAV: CDC, Prevention of Hepatitis A through active or passive immunization.
